Product description

The CompressPack is used to verify the integrity of seals on plastic or metal packaging such as doypacks, doypack refills, pouches, bags, and tubes, directly on the production line or in the laboratory. It can be used alongside ATS tube welding testers. Why test welds? During hot welding, defects may occur in the weld due to electrode temperatures and the presence of impurities. Performing a compression test allows you to verify the integrity of the sample's weld, ensuring there are no leaks or micro-leaks. This test is essential to validate the proper sealing of the samples.
